

APPENDIX A. PROPERTIES OF THE ELEMENTS

Table 1 lists atomic weights, densities, melting and boiling points, critical points, ionization potentials, specific heats. Data were taken from the 75th edition of the *CRC Handbook of Chemistry and Physics*¹. Atomic weights apply to elements as they exist naturally on earth, or, in the cases of thorium and protactinium, to the isotopes which have the longest half-lives. Values in parentheses are the mass numbers for the longest lived isotopes of some of the radioactive elements. Specific heats are given for the elements at 25°C. Densities for solids and liquids are given at 25°C, unless otherwise indicated by a superscript temperature (in °C); densities for the gaseous elements are for the liquids at their boiling points.

The solar system elemental abundances (atomic %) in Table 2 are from the compilation of Anders and Grevesse², and are based on meteorite and solar wind data. The elemental abundances in the earth's crust and in the sea represent the median values of reported measurements.^{1,3,4,5} The concentrations of the less abundant elements may vary with location by several orders of magnitude.

Table 1. Chemical Properties

Z	El	Name	Atomic Weight (a.m.u.)	Density (g/cm ³)	Melting point (°C)	Boiling point (°C)	Critical point (°C)	Ionization potential (eV)	Specific heat (J/g K)
